# ID:1 - Use case description

| Use Case Name: Access astronomical data | ID: 1 | Importance Level: Medium |
|---|---|---|
| Primary Actor: Science observer | | Use Case Type: Essential |

| Stakeholders and Interests: |
|---|
| Science observer - wants to collect and manage astronomical data<br>Astronomer - wants to access collected astronomical data |

| Brief Description: |
|---|
| This use case describes the ability of astronomers and science observers to access collected astronomical data from the system. |

| Trigger: The astronomer wants to know and access astronomical data for analysis.<br><br>Type: External |
|---|

| Relationships:<br>　Association: Astronomer<br>　Include: -<br>　Extend: -<br>　Generalization: User |
|---|

| Normal Flow of Events:<br><br>1. The astronomer or science observer logs into the system.<br>2. The science observer has access to the star catalog.<br>3. The science observer collects astronomical data.<br>4. The science observer validates the integrity of the collected astronomical data.<br>5. The astronomer accesses collected astronomical data. |
|---|

| Subflows:<br>S–1: Searching for the astronomical data the astronomer needs.<br>　　1. The system displays all astronomical data to astronomers.<br>　　2. The astronomer searches for data.<br>　　3. The system retrieves and displays the requested astronomical data. |
|---|

| Alternate/Exceptional Flow:<br>　- The system will notify the user if the requested data is unavailable in the system's database or archives.<br>　- If the system encounters technical issues while retrieving the data, it will notify the user. |
|---|

## ID:1 - Activity Diagram

| Science observer | Astronomer |
|---|---|

**Science observer:**
- Access system
- Access star catalog
- collects astronomical data
- validate data integrity

**Astronomer:**
- Access collected data
- Search data
- Retrieve and display requested data

# ID:2 - Use case description

| Use Case Name: Create an observing program | ID: 2 | Importance Level: High |
|---|---|---|
| **Primary Actor:** Science observer | | **Use Case Type:** Essential |
| **Brief Description**: The Science Observer creates an observing program based on the Science Plan | | |
| **Trigger:** The astronomer wants to conduct an observing program<br><br>**Type**: External | | |
| **Preconditions:**<br>1. The Science Observer is authenticated by logging in to his/her account<br>2. The Science Plan is created, tested via the virtual telescope, and submitted to the system by the Astronomer<br>3. The Science Plan is validated by the Science Observer | | |
| **Normal Flow of Events:**<br>1. The Science Observer selects the "Create Observing Program" option from the menu<br>2. The system displays a create observing program page, which contains several fields to input and a button to submit the program.<br>3. The Science Observer inputs the details of the observing program including plan no., optic primary, f-Stop, optics secondary RMS, and fold mirror degree.<br>4. The Science Observer selects the fold mirror type option.<br>5. The Science Observer inputs the module content and calibration unit.<br>6. The Science Observer selects the light type of option.<br>7. The Science Observer inputs the teleportation pair.<br>8. The Science Observer clicks the submit button to create the observing program.<br>9. The system displays the state of the observing program (valid/invalid). If it's invalid, return to step 3. | | |
| **Postcondition:**<br>1. The details and configurations of the observing program are stored in the observing program datastore | | |

## ID:3 - Use case description

| Use Case Name: Change Observation Schedule | ID: 3 | Importance Level: High |
|---|---|---|
| Primary Actor: Administrator | | Use Case Type: Necessary |

| Stakeholders and Interests: |
|---|
| ● Science Observer<br>● Astronomer |

| Brief Description: |
|---|
| This will provide data when the administrator will change the plan for observation. |

| Trigger: |
|---|
| When the administrator has to change the schedule from a request form from a system control center.<br><br>Type: External |

| Relationships: |
|---|
| Association: Administrator<br>Include: -<br>Extend: -<br>Generalization: - |

| Normal Flow of Events: |
|---|
| 1. If there are any issues occurring.<br>2. The System Control Center will get a notice from observers.<br>3. Administrator gets the notice to the system.<br>4. Administrator check the current observation schedule<br>5. Administrator checks the available day to reschedule.<br>6. Administrator reschedule on the systems.<br>7. Administrator announced the new schedule for observation. |

| Subflows: |
|---|
| ● The rescheduling should be announced to the science observer and astronomers. Also, it should be known to the related people.<br>● This schedule should be accessed by using the authentication process to verify identity.<br>● The new schedule should be announced directly to the systems. |

| Alternate/Exceptional Flow: |
|---|
| ● The schedule that makes changes will not be available for unrelated people.<br>● If conflict issues occurred during rescheduling the administrator will not be able to schedule new for new observation. |

# ID:4 - Use case description

| Use Case Name:<br>change unit status | ID: 4 | Importance Level: High |
|---|---|---|
| Primary Actor: TelescopeOperator | | Use Case Type: Functional |

| Stakeholders and Interests: |
|---|
| TelescopeOperator: Track and manage telescope readiness for observation tasks.<br>Astronomer: Plan their observations and rely on functional instruments.<br>Administrator: Making informed decisions regarding equipment usage and upkeep. |
| **Brief Description:**<br>Changing unit status means updating the equipment's condition to know if it's ready for observation. |
| **Trigger:** When equipment experiences a failure or malfunction, it triggers a change in status to indicate the need for repair or replacement.<br><br>**Type:** external |
| **Relationships:**<br>   Association: TelescopeOperator, Administrator<br>   Include: Install & Remove unit<br>   Extend: To effectively execute the task of changing unit status within the broader context of telescope operations.<br>   Generalization: - |
| **Normal Flow of Events:**<br>1. Scheduled maintenance to start the process.<br>2. The system checks if the trigger is valid.<br>3. If valid, the telescope status is changed.<br>4. Telescope operators are informed.<br>5. The change is confirmed and recorded.<br>6. The system goes back to its regular tasks. |
| **Subflows:**<br>1. should be regularly checking and fixing equipment to ensure it's working correctly.<br>2. should be reserving it for the task, and ensuring it's available and ready for use. |
| **Alternate/Exceptional Flow:**<br>1. If there are big problems, mark it as "Out of Service."<br>2. If there are no parts, mark it as "Awaiting Parts."<br>3. If there are problems, mark it as "Installation in Progress."<br>4. If not available, find alternatives or reschedule. |

| Actor | System | Administrator | Telescope |
|-------|--------|---------------|-----------|

1: Scheduled maintenance

1.1: Check trigger validity

1.2: Valid trigger

1.3: Change status

1.3.1: Inform operators

1.3.1.1: Confirm & record change

1.3.1.2: Change confirmed

2: Regularly check & fix telescope

2.1: Check & fix telescope

3: Reserve telescope

3.1: Reserve telescope for task

4: Handle big problems

4.1: Mark as "Out of Service"

5: Handle no parts

5.1: Mark as "Awaiting Parts"

6: Handle problems

6.1: Mark as "Installation in Progress"

7: Handle unavailability

7.1: Find alternatives or reschedule

## ID:5 - Use case description

| Use Case Name:Create Science plan | ID: 5 | Importance Level: Hight |
|---|---|---|
| Primary Actor: Astronomer | | Use Case Type: Functional |

| Stakeholders and Interests: |
|---|
| Science observer:Science observation and the collect of data<br>Astronomer:Scientific observation |

| Brief Description: This use case allows astronomers to create a plan for Science observation. |
|---|

| Trigger: An astronomer plans to execute an observation.<br>Type: initial processing |
|---|

| Relationships:<br>   Association:Science observer,Astronomer<br>   Include:Test a science plan<br>   Extend: for real time adjustment<br>   Generalization: - |
|---|

| Normal Flow of Events:<br>   1. Astronomers log in the Gemini Telescope Control system(GTCS).<br>   2. Astronomers select the science plan.<br>   3. The system shows detail about observation times, required instruments.<br>   4. Astronomers input data such as<br>   5. Astronomers submit scientific plans. |
|---|

| Subflows:<br>Astronomers test the plan in GTCS's simulation capabilities to verify the viability of the science planning. |
|---|

| Alternate/Exceptional Flow:<br>If the science plan is not approved during the validation process, the astronomer will resubmit the plan. |
|---|
